Trading Tigers

TIGS Whitepaper

Binance Smart Chain, we see an opportunity here to create a token that is cheap to transfer.

Since we need a token for our payment system, we saw our opportunity as a BEP20 token.

We will be adding more features to our software over time, and to use them you need TIGS.

The amount of TIGS needed will decrease over time and can be calculated at the time of software release and token price. This way, early investors can easily sell TIGS at a later date and still use all the new features.

Trading Bot Vision

Technical analysis or fully automated trading strategies are a matter of course nowadays. Unfortunately, it is not always possible to find a trustworthy provider.
We have already developed some terminal applications that are able to check your selected trading pairs for stop-loss and take-profit and/or indicators.
They are already executable on Windows or Linux and usable to trade or receive signals via Discord Webhook.
We will implement different modules over time, collect feedback, make improvements and in 2022 we will release a GUI that will allow anyone to easily set up their bot in a user interface that runs locally on your system.

3

Token Sell & Airdrop

The number of tokens is limited to 100,000(100k) TIGS, the first 40,000(40k) TIGS will be added to Bakery/PancakeSwap as liquidity, and the price will be kept at min $0.05 max $0.15 during this period.

Soon as 40,000 TIGS 40% are in circulation, the first airdrop will take place.

In the first airdrop, 5,000 TIGS will be distributed to all LP token holders.
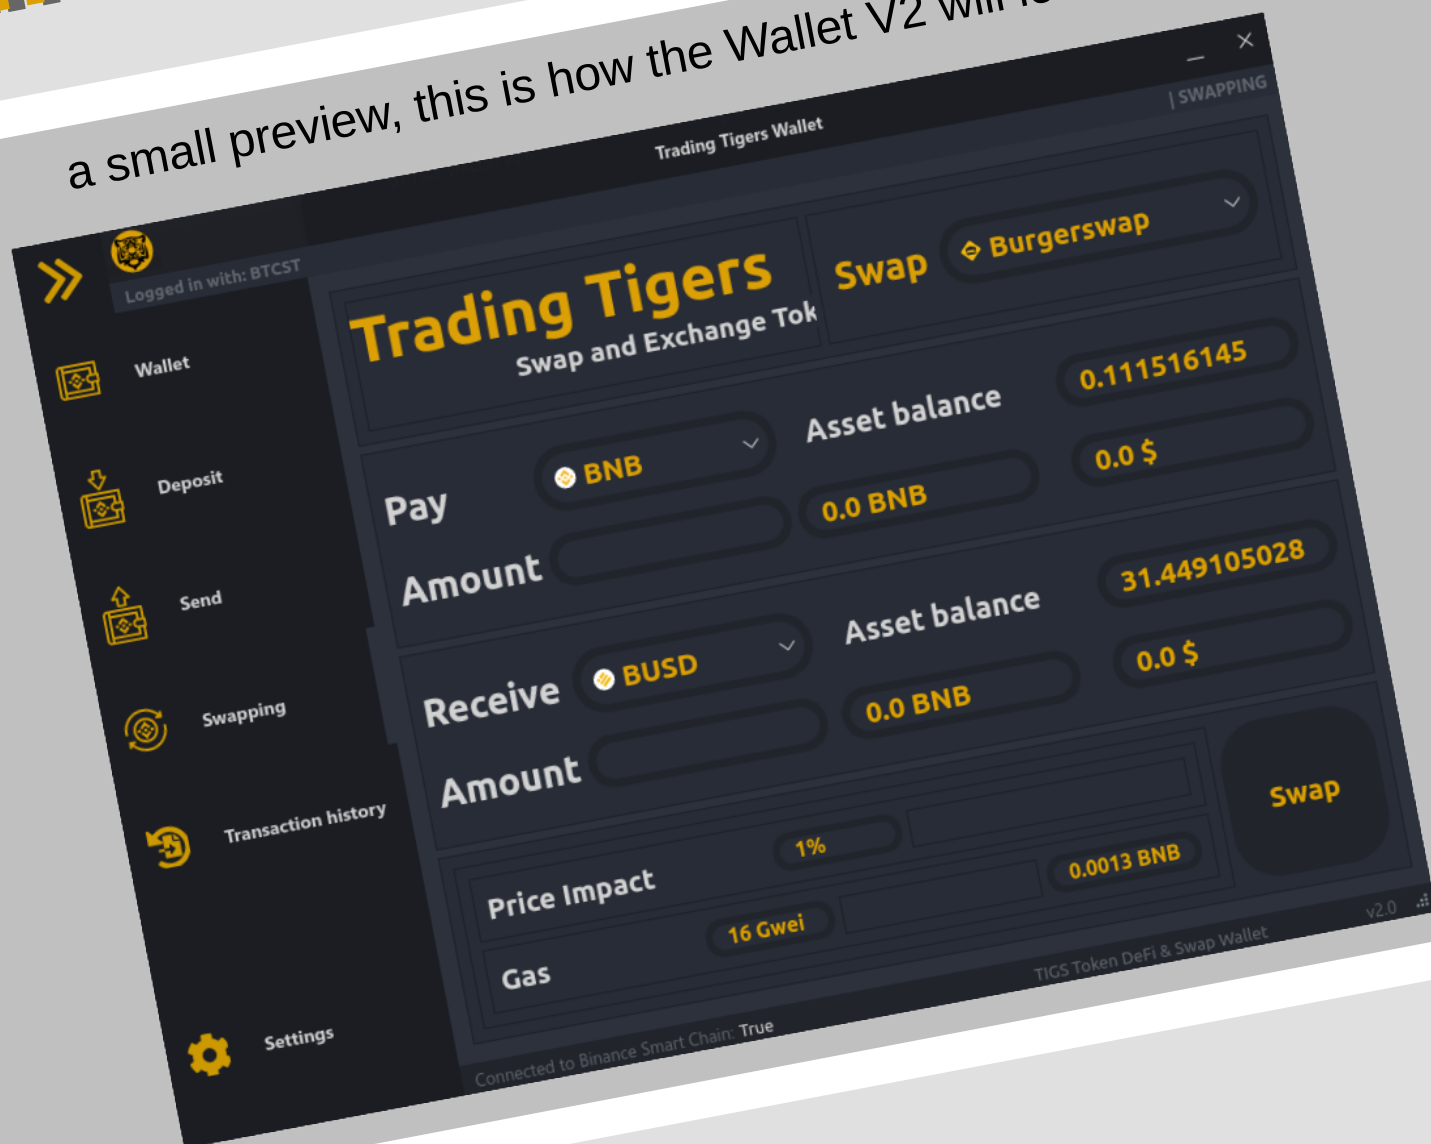

In the second airdrop, TIGS token holders and LP holders with 5,000 TIGS will be distributed.

In the third airdrop, all users from the airdrop form and LP token holders will be rewarded with 5,000 TIGS.

Wallet-Vision

a small preview, this is how the Wallet V2 will look like.

Wallet-Vision

Our wallet runs 100% local on your system, you manage your secret keys yourself, they are encrypted with your password when stored, and are never accessible again without your password.

There are so many new DeFi and Swap projects in the Binance Smart Chain, we see the problem with the slow/overloaded web interfaces of these Swaps Liquidity pools and that they often disappear.
After web interfaces of the swaps/pools are no longer accessible, it is no longer possible for the normal user to get his deposited liquidity or stacking out of the pool, for this we will develop the TIGS Wallet which allows in the later stadium each user to use his own swaps/pools as needed without having to act with the website.
